>Hmmmm. I just went to microcenter.com and I didn't see anything like you
described. For Winbook, I only see a GL-35 and a TL-35, but neither have

what you describe and both are \$899.99. I am familiar with the Winbook and was an owner of one a few years back. Honestly I will never buy their product again. Unless they've improved over the years, they were basically a thrown together foreigner company in Ohio buying cheap Chinese parts and putting together very cheap laptops. I found this out after I bought a new Winbook directly from that Ohio company. The power plug adapter inside the computer first just fell apart one day... along with a few major/minor things only to have the things rendered worthless within about 2 years. The manufacturer warranty was only like 90 days (ridiculous) and not to insult anyone but I am just being honest, the folks at the company where I bought could barely speak english.

Again, I hope they've improved over the years and I wish you luck... but personally I think places like walmart have awesome deals on new Acer and Toshiba... yes they come with Vista... but the prices are really good. Just bought my wife a new Acer 5920 for a little over \$700 (that includes the 3 year replacement plan) and it is loaded, Intel Core 2, 3gb memory, surround sound, etc etc...

>Don, if you haven't committed to an instrument yet -

I went to the local guitar boutique many times with my engineer to cost out instruments for recording and to look at a wide range of prices. We kept coming back to the cut-rate Martins (the DX series with the composite necks). It's true that out of the ones I've tried some have been uneven in quality/tone, ranging from superb down to merely "good". But the superb ones have been amazing - not "good for their price", just "really good" - they've completely blown away guitars costing six or seven times as much, including much more expensive Martins. The best ones have definitely got "that thing" that says "record me".

If you can get a bunch of them together and find the "pick of the litter" you might be pretty surprised at what you're holding for \$500.

quot;. I never had this
happen before. Any thoughts?

Thanks, TyroneOh, hi Ed - I wasn't really following who said what specifically, but in hindsight, yes, it was your own post that inspired mine. I'd agree wholeheartedly that my experience confirms your own, that there are some extraordinarily good values in "cheaper" guitars nowadays and that \$500 or under can buy a great deal of guitar for a smart shopper. The Martins happen to be fresh in my mind because I just played them again yesterday afternoon.

e extravagant.

Lastly, in my opinion you are in the proper newsgroup and not off topic... politics and someone's back yard animal is off topic. Music related is not... that's just my opinion and hope others feel the same...

Have a great day and do yourself a favor and try out those Ibanez and save yourself hundreds... unless you just like spending money... I am still a peasant and can't do that. Never heard of the brand, but one thing when trying out guitars in a store is look at the condition of the strings. If the Larrivee had old strings its tone could never compete with a guitar with fresh strings. Your mention of the strings going out of tune indicates they may have been very new.

I just recently started rendering files with native plugins after testing the rendered against the edited original and flipping the phase (copy channel settings to the new track with the rendered file etc etc) I've been happy with the result. Any prior nudging for latency (with UAD for instance) is accounted for in the newly rendered file and it saves time and horsepower. I hadn't used PARIS for a few years until last summer, and remembered the debate between Sakis and others over whether rendered files - with or without plugins - were as accurate as bounced files. So far so good.

Wonder how it does with latency.

JHNever used that product exactly, but know VMWare pretty well. Nice app, no problems on XP, some gotchas on linux boxes, but there are decent workarounds. However, the things that I think set it apart are really server side stuff, automated failovers, fault tolerance, snapshotting, etc. For desktop stuff at home I use Virtualbox, which is available for OS X. Again, can't speak to it's stability/usability on other platforms but it's how I have a little slice of Debian even on my XP audio machines.

My KID could play better than that...

Hey wait, my kid DID play that....

snork

DCWhat I want to do with it is run Autocad on a new Mac Pro (on XP of course) while still using a bunch of Mac apps .

The Apple tech guy actually recommended it highly for this sort of thing. No audio uses, just design work. I have heard that Autodesk may come out with an Autocad version for macs, but I am sure they won't until I buy XP, and Fusion, and debug it, so I might as well get started...

grrrr

Another thing I wonder about is whether XP running under fusion is still subject to all the malware and viruses that a PC is? I could not get an answer on this on the VM site. Waddya think?

thanks

I would not run PC audio apps inside Fusion. Any audio I do will be Mac based only so it shouldn't be an issue.

DCbut can he play RUSH ! ?Again, I haven't used this particular product at all, so I can't say for sure.

I like Virtualbox, because it's free (as in both speech and beer, though Sun bought it and they're still getting their heads around free as in speech, but they're getting closer I think), it works, it has a very small footprint and it likes Debian. My guess is, and again, I can't say this for sure, at the desktop level the advantage of VMWare's commercial product will be integrating with the host OS. The clipboard will work better, that kind of thing. That's not a huge deal to me, but might be for you.

As an example, I'm writing this email from my DJ/Live performance laptop. It sits in my TV room so I can play with stuff during the NBA finals. I've been doing a LOT of database coding at work lately, and my preferred dev tools are PostgreSQL and SQL Explorer in Eclipse. Well, I don't want a bunch of java shit and development tools running in the background and hogging memory when I'm making music. So, at the cost of a few GB of disk space I can have Debian, Postgres, and Eclipse all cheerfully running _when I want them to_ on my music laptop. For me Virtualbox does all of that swimmingly, but I don't need to copy and paste Autocad output into Photoshop on the host OS. You might.

As far as malware and viruses, you're VM will be exactly as likely to have problems as an actual hardware XP box. As I always say, if you don't click on email attachments, keep the XP firewall on, and don't go to porn sites, you're good on that front 99% of the time.

enough to where

I have decided to go exclusively with XP32. I have a fairly powerful systemlinked slave DAW to take up the slack if I run low on RAM in a mix and need more VSTi's (not to mention the freeze function).

and yes James.....I'm sure a Mac Pro can run circles around this, but a Mac Pro, tricked out to this degree would cost considerably more ;o).

For me these days, it's about achieving a certain benchmark and that benchmark is to be able to use a native DAW with no audible latency, in the same way that I used Paris. that has been accomplished now.

I just wanted to give you guys a heads up about this and also to apologize for being such a cantankerous wiseass (even more than usual) lately. I did buy some Brie recently as a gesture of solidarity with my socialist bretherin in France....

Cheers,

;o)"Deej" <noway@jos

so anyway, I know I've been abraasive and cranky oand a little whacked out so thanks for not kicking me out of the group.....and during this time, I've had Chris Ludwig build me a new DAW.

It's an Intel Quad Core machine and is capable of playing back 40 tracks at 1.5ms latency while recording 8 more with a 70% DSP load of UAD-1 plugins. In Parisspeak, that's roughly a 3 MEC system running lots of UAD-1 plugins at zero audible latency with a wonderful cue system, VSTi's, and every bell and whistle you can imagine, without using ASIO direct monitoring. ADK did a great job on this box and it wasn't real expensive. the cores are running at 3.2GHz per, it's got 4G of RAM and 4 x 500G 7200 RPM SATAII HD's configured into a RAID 10 Array. I'm also running a pair of 750G

SATAII drives
for audio samples and backup, respectively.

Does it sound like Paris? Nope, but it sounds very good. It's possible to mix in Native and get "BIG". It's just a different prescription. The Neve 5042 tape emulator doesn't hurt either.

I ordered it with two system drives, one running Win XP Pro and the other running Win XP x64 Pro. The first drive I tested was with Win XP64. The good news was that this DAW is quite a bit more powerful than my dualcore Opteron 185 so I was able to achieve the 1.5 ms latency target that I was hoping for. My VSTis' are as follows:

GPO
Ivory
NI B4
NI Bandstand
BFD
BFDII
Jamstix II
Trilogy
Drumagog

I was able to load all but one of my VSTi's and that one was Ivory. This one wouldn't play nice with a 64 bit OS.

Despite speculation from Native Instruments that the NI installer would not work in Win XP x64.....all of them did load.....NI B4II, GPO and Bandstand work fine in both the standalone and VSTi formats. It's just a matter of pointing them elsewhere instead of the default path it wants to use and they run just fine.

Performance was good at low latency, but not "as good" as I had hoped with high track counts. For instance, I had 60 + tracks record enabled at both 32k and 64k buffers and was getting between 25% to 35% CPU loads. Also, there was quite a bit of ASIO loading in Cubase when streaming samples in BFD and BFD2. More really than with my older Opteron system.

After working a while with XP64 I started loading the same programs on the system drive running Windows XP32. I can record enable over 100 tracks at 32k buffers and the CPU load is around 10%.

An even bigger difference is seen when playing back a project that is loaded down with plugin count. Playing back a 40 track project with a 70% UAD-1 DSP while recording 8 x more tracks was getting a little dicey at 64k buffers on XP64 (ASIO meter occasionally spiking). With Win XP32, the ASIO load during dubbing on this same project is much lower and the overall system performance is more solid. Sample streaming in BFD at low latencies is much improved.

At higher latencies the ASIO performance is roughly equal but the overall performance nod goes to the XP64 because it can utilize all 4 x G of RAM for use with virtual instruments. However, the main point of getting this machine was to take advantage of it's capacity for operating at lower latencies. As far as low latency performance is concerned, the margin between the two OS'es give Win XP32 a significant edge.....significant

-----=_NextPart_000_0015_01C8BD90.DC9AEC60--Hey Don,

Slow down :-) The great thing about a VM is that you don't have to turn the 'virtual' network card on at all. It's definitely possible to run XP networkless on a MAC.

Chuck

Bill the DAW (with the exception of the audio hardware) the DAW was in the neighborhood of \$2500.00.

I'm using 5 x different outboard reverbs here. They are interfaced via AES with RME ADI 8-DD units so as to be able to up/down sample in real time when I'm working at sample rates above 48k.

I'm running an RME MADI, an HDSP 9652 and an AES 32 card in one 13 slot Magma that is interfacing with the mobo via PCIe. I'm also running another 13 slot Magma with 4 x UAD-1 cards which is interfacing with the mobo via PCI.

Converters are 3 x RME ADI8-DS units and Mytek Stereo AD/DA's. I'm monitoring through my Benchmark DAC-1

It's a nice and very stable rig. Sounds great and that is a reasonable price, but my question was this:

let's say you are tracking a singer that wants some verb in the cans. Do you use outboard or track with a plug or could you do either?

2EDS Cards
and 2 control 16 surface blue
2 MEC's
I have an extra control 16 black face
they both have the latest PARIS software installed
and they sync up

I'm just trying to see what I can get for this stuff

the gear is in San Jose CA.
I am in Beijing I will be going back home sometime in July
to sell somethings and move to China
I'm not completely sure that I will sell my PARIS gear
but if I get the right offer.

anyone interested please feel free to contact me

THX.
CliffordSo, I could have the Mac access the net, but not the PC VM?

That would be cool indeed.

I would need to access it now and then for app and OS updates, but
if I could never use a browser or mail app in XP land I would be
very happy.

Am I on the right track?

thanks

JohnMike,

In my case, the rig has just been collecting a lot of dust and to top it
off I have had to re-arrange things due to space restrictions.

I'm afraid that by the time I have enough project space to get everything
going again, the rig will just be more obsolete and worth zero. I've been
out of the loop for a long time, what new development are you referring to?

Glad you're feeling better. I've developed a general curiosity about the domestic oil/gas business in my new job. I don't envy you doing what you do.

Also nice to see native is getting good enough to be the real deal for you.

I've been talking about native for years, as you know, and in the long run we'll _all_ be doing native. And I mean the Mutt Lang types as well. Moore's law spares no one.

My fave thing about the quality of native is that it's letting me put my big bucks where it really matters, into a smaller number of choices pieces of analog gear like mics and analog synths.

Would a port of all the effects to VST be close enough?Hi all. I was going to save this post for a bit longer until I had more info to share, but it seems particularly timely today.

Sorry this is a bit long - the summary is at the end. But as I'm putting out an appeal here, you should have full access to my "source code" :D

As my previous posts have implied, I've been busy contacting people in various places about the possibilities of pushing PARIS forward. I've talked to many companies/developers. Some names might surprise you. There are very interesting avenues to pursue, and obstacles to overcome to get there.

Development involving the PARIS app itself (eg EDS plugins or the FaderWorks PDC advances) looks to be in excellent hands courtesy of Mike Audet and Dimitrios and others. I'm focusing my own efforts elsewhere - I'm

investigating what alternatives might exist for the PARIS hardware independent of the PARIS app. This involves investigating things like what driver options could be pursued; what alternative "front end" apps might feasibly be adapted to access the PARIS hardware; and how we might obtain the ability to import/migrate ppjs/pafs into another app to "future proof" our access to our "back catalogs".

I can only promise I'm working hard in the background and have devoted many hours already to the effort. I can't make promises on behalf of others, but I see the bulk of items on my list as more "to do" items than a "wish list", and if two minor goals I'm working towards happen then I'd rate at least one of the developments (safeguarding our ppj/pafs) as both "fairly likely" and "within a reasonably short timeframe".

BTW, I have already rejected some promising solutions that involved asking the community for significant sums of money for development specific only to PARIS. I've talked to genuinely interested developers, folks with great track records and real good will who have offered me every break in the book, but I don't propose taking the community down that road. I'm instead seeking developers who will help for their own reasons. Like this one: Mike Audet and I have independently estimated the PARIS userbase as some 400 users worldwide (I have recorded over 40 within the last few months amongst the subset of PARIS users that post to the NG). Capturing a market of that size is not insignificant for a smaller developer looking to build their clientele - it can be worth them throwing some effort into investigating making those people happy (particularly if the developer has existing code that might merely need tweaking). And there are aspects of the PARIS community that might make it more interesting to certain developers than raw numbers might dictate.

>>>>

Here's the immediate obstacle I want to ask the community about.

Even the most interested developers can't do much for us if they don't have a PARIS rig - and in 2008 PARIS rigs aren't easy to run out and buy. Given our small size as a market, if we as a community are asking a developer to do things for us, then telling them "go out and source and purchase a PARIS rig so you can help us out" isn't gonna fly. Neither is promising a developer you'll get them access to a rig to test on without being sure you can deliver. If the community wants developers to work on PARIS, and those developers have to have a PARIS rig available in order to help us - then IMHO it's *in the community's best interest to provide one to them*.

>>>>

So this is a "feeler" post. IMHO the community needs a pre-assembled, "turnkey" (ie pre-installed on a computer) PARIS development rig, ready to

be shipped to developers that could do it the most good (if you've guessed that I have destinations in mind to offer this to already - well, you're a good guesser :D).

Ideally this rig would be a multi-card, multi-MEC system containing at least one of every existing PARIS component we can get our hands on so PARIS can be thoroughly tested in larger configurations. No more of this "sorry, we didn't have a full system to test" thing. But as a start we'll settle for whatever we can lay our hands on.

In addition we'd need a PARIS community member who lives in the 48 contiguous states (to keep shipping costs and delays low) to volunteer to be the occasional "depot/shipping person". They'd be the person that received the donated components, tested them, assembled them into a rig, and sent it to where it needed to go, and if needed (although if it finds a long-term home fast, that's good news for us) receive it back and ship it elsewhere.

BTW,

Subject: Re: China

Posted by [excelav](#) on Tue, 18 Mar 2008 07:31:44 GMT

[View Forum Message](#) <> [Reply to Message](#)

I'd do it myself in a heartbeat, but I'm in Canada - don't even ask what international shipping would add to the hassle and the cost and the delays. I've already had the first potential volunteer interest, and he's a name you've all known a long time, but we're clear that there are some commitments I need to obtain from others before we can ask him for his.

Incidentally, obviously I'm not proposing we stick that volunteer, whoever it winds up being, with picking up shipping/packing charges. I'd propose setting up something like a PayPal account for them in order to let the community chip in a few bucks apiece to cover any reasonable packing/shipping costs. I'd nag, too - these are trivial "beer money" costs for a community to absorb, rather than a lump for an individual.

>>>>

As mentioned, this is not an actual call for components yet - it's just an "assessment" call to determine if folks would give concrete support to this idea. I'd put everyone fully in the picture on *where* I was proposing it to go (and of course *why*) when I made the actual call for components.

PARIS hardware prices have plummeted so far that the gear's hardly worth selling now - (\$25 for a C16? Feh, the faders in it are probably worth more than that as salvage!), and there's the possibility of very exciting developments if everything worked out well.

So if you're contemplating blowing PARIS gear out at absurd "it's gathering dust, make me an offer, just get it out of here" fire-sale prices anyway - a component or two, or an old but functional PARIS-equipped PC, or even a full rig - would you consider donating components to such a "development rig" effort instead?

In addition, would there be any interest in making a small donation to a community fund to purchase any components we're missing after we see what the donation call brings in? 27 MECs won't help us if we only have a single EDS card.

I've got no promises to give in exchange at this moment, except my own, that I'm working on things. But this is what's needed to get 'em done. Let me know what you think.

- Kerry Galloway
Hi Kerry-

I'm in Toronto area, but would be willing to handle the shipping etc of an EDS card. _It needs repair by The Soniq_ which I would pay for. Ideally, it would be nice after having it repaired, and with the prospect of the hardware being more usable to have it returned at some point in the future. Is this possible? It's not a deal breaker, but a preference.

> Definitely a big step in the right direction, IMO. If my understanding of
the structures is correct, having the same 'vat' of headroom will be * key
to that paris sound, so there is likely to be some math involved on the
front and back end moving bitrates around. That would likely be the ticket
here, if we could emulate the mix bus and insert 'that' as a VST in the mix
bus of native DAWs. The next hurdle I'd see is getting it to work correctly
past 48k, which may or may not be a hurdle, but it's an important feature.
If Doug W can make that fader pack affordable and usable with both Paris and
Native-land it will also help greatly with the paris to native transitions.
Some folks aren't going to go easily, some have already left and some (like
myself) are using which ever tool best suits the situation at hand. Native
latency still stinks on the overall, IMO. You gotta spend lots to fix it,
although I'm hoping the Yamaha / Steiny thing will resolve much of that.

The reason I say the emulation is that you can load up an emulation device
(and use ASIO to address the unknown audio interface), fire the Paris
software to it, and load as many virtual EDS cards as you want or need (not
to be confused with the native mixes available.. those SUCK a

Well.....I thought I was gonna have to eat some major crow today. I was configuring a basic template and all of a sudden the whole then started losing sync....and I mean, like.....totally FUBAR. I was finally able to trace it down to a couple of settings with the control panel in my AES32 card that needed to change. That one is digitally interfacing with all my outboard reverbs. I'm clocking/syncing 17 different interfaces here. All is well now though....and to think.....when I sold my Paris system, I did it thinking that I was going to "simplify" things.

It is running soooooo nicely now.....and everything just integrates so flawlessly and it's so friggin cool!!

You can take the boy out of the madhouse, but you can't take the madhouse out of the boy.

;o)It's not GB in particular, it's the entire genre. There are only a few genres of music that drive me nuts no matter how well they're done. For example, in general I'm not a big country music fan but I _love_ George Jones, Townes van Zandt, Allison Kraus, Steve Earle, and so on. Not a big heavy metal fan but enjoy AC/CD and Motorhead just fine. But I've yet to hear a smooth jazz outfit that I could stand listening to.

So in GB's case, his starting to sing more or less coincided with his turn into the smooth jazz world. When he was a bumping young kid playing in organ trios I love his stuff, but that's where I lose the plot.

Nothing personal, and I don't deny his talent and chops, but I don't deny Joe Satriani's chops either but I don't listen to him.

>>Hi DJ,

This is what they said:

Hello,

latency is measured from inout to output.

Regards,
Daniel Fuchs
RME

Those are spectacular numbers for a native system. Even at 2.25 ms, that's pretty good.

Very cool. Thanks for letting us know about it.

at Jackson and he's playing military grip with his left hand and moving that
hand about four inches off the drum and the snares are like gunfire.

<http://www.youtube.com/watch?v=3UIQVhMABwg>

I still wonder how the hell he did that. Maybe it's that elusive combination
of 'talent,' 'technique,' and 'practice' I keep hearing about.

The rest of the band is pretty good too. Oh, and the vox don't suck. Decent
song now that I think about it.

One has two ADAT'S and EDS 2 has three (mostly for a safe place to store it). When I got a blue face involved, it wouldn't work but with all black face, I've been able to get all up and recognized with no issues so far. Still haven't figured out what to do with that much I/O though.

:~)

Seemed to stabilize things when I reinstalled the driver and effects subsystem after any changes to hardware.

How about an emulation of the ESP chip that runs on an FPGA?

Doug

<http://www.parisfaqs.com>Mike Audet wrote:
> I suspect that the biggest thing about the PARIS sound is the quality of

There has been a lot of talk over the years about where the PARIS sound comes from. Let me point out that you can import wave files that weren't created with the PARIS A/D and you can play them via S/PDIF to an external D/A (Benchmark, Lynx, etc) and you'll still get the sound...

Doug

<http://www.parisfaqs.com>Doug,

How's the fader project coming?

.... assuming that a usable PCIe is available and a Magma works with it. I can see a day when that could end, though. Even Digi sees the light on that with the whole mBox series. It's all gonna go virtual on us man.

> How about an emulation of the ESP chip that runs on an FPGA?

I would love to see it man. Absolutely love to see it. I was kinda thinking at least for now that 'old' graphics cards (UAD, cough cough) could be just what the doc ordered. Real time 4 band per channel EQ just shouldn't be that big a deal now with the VST Paris EQ available, and with CPU's what they are these days, neither are plugs. However, by keeping it in EDS land for the code, Mike is all but assured some kind of friendly dongle to stop pirating without infecting our boxes with PACEware or it's equivalent. I love that idea, personally. If you can do that on FPGA, dude... perfect. If it could run on firewire w/o bandwidth issues, I'd say it's pretty well foreseeable futureproof. What kind of socket/slot would you think best fits?

I took a bit of a break from the marking and worked on creating a white noise generator for PARIS. I think our old girl still has legs. :)

Cheers!

>I don't use it right now but when I used it don't remember any such behaviour...

Regarding midi why do you use midi ??

Have you made Cubase follow the ASIO 2.0 sync option ??

NOT the Midi timecode neither the MMC option.

When using the asio 2 sync option midi is not needed in any way for syncing.

The bars info comes from adat sync...

>Ok,

There are some dither plugins (VST) like the MDA dither which are free but if you want a great sounding dither option everytime you might use the adat 20bit digital in and out (as I do) for external processing during a mix (as I do) and you wanna make sure that dither is applied you can either use y\the waves IDR (at 20bit if you are using the adat ports) OR if you wanna use UV22hr and you come to own Wavelab you can just record an empty 24bit paris file and then apply a UV22 20bit LOW dithering on it and save it as a UV22_dither_20bit.paf

The file is still 24bit but you have actually a dithered 20bit file to use with adat processing.

You have to use the LOW choice because you are gonna dither again your last mixed wavefile.

Same way you can make a 16bit NORMAL UV22 file (mono) and use it on a Paris audio track (one only) on any submix if you wanna make your final stereo mixfile.

Regards,

DimitriosI mentioned mono file.

OK when using wavelab to make a proper use of UV22 use an empty (record nothing) STEREO file of say 7 minutes apply UV22 LOW 20 bit dither and then save only the Left channel as Paris paf 24bit mono file.

Regards,

Dimitrios

>Regards,

>DimitriosDi, I don't use midi to sync, only midi within Cubase for a click.

Basically; Paris tells Cubase to start rolling via adat sync (scope), then

Cubase sends a click signal via midi (scope midi out) to an external tone

generator (D4) and I monitor the D4 audio output back into a Paris channel,

that is the mp3 you heard. But I have tried using midi to sync via

"midioverlan" in Paris and Cubase

e and it starts right up and is stable (no

strange wobble @ first). Yes I have the ASIO 2.0 sync option enabled. I'm

gonna check my 9pin D-sub connector tonight, maybe it's bad or the wrong one.

It is a regular straight-thru 9 pin, not a null correct?

Thanks Dimitrios

Regards,

Robert

Good. I received both the "N" type and the "K" type Alps faders. The K types are especially nice - I have a hard time imagining how the Penny & Giles faders can be worth 4x the price of the Alps...

My fader control circuit works well with the N type (which is what I think the Euphonix control surface uses), but the K type motor is too fast for me, so I keep overshooting! I need to modify my circuit to react more quickly for the K series.

I decided to associate one rotary encoder with each of the motor faders.

The function of that enc

>"Aaron Allen" <know-spam@not_here.dude> wrote:

>Magma babee...!

>

>... assuming that a usable PCIe is available and a Magma works with it.

I am currently running 2 x 13 slot 32 bit Magma chassis, one of them with the new Magma PCIe host card that interfaces via the round SCSI type cable to a PCI host card in the Magma.

slots 1, 5, 7 and 11 in the 13 slot Magma will host PCI cards that share a common driver so they can all live on a single IRQ if the host card is interfaced with the proper MOBO slot.

in one magma I'm running 4 x UAD-1's (slots 1, 5, 7 & 11) and 2 x Powercore cards (slots 2 & 4) on IRQ 19 and 20 of the new DAW and in the other Magma that is interfacing via PCIe, I'm running an RME HDSP 9652, a MAD1 and an AES32 in slots 1, 5 and 11 of the Magma and these cards are populating IRQ 18 of the new DAW.

It runs like a bat outta' hell with 1.5ms latency so this would indicate to me that the new PCIe Host card for the recent generation of Magmas that use the round cable (can be had for around \$500.00 on EBay) will definitely carry the EDS card (at least 6 x of them) into the future with PCIe based mobos.

Worry about other things.....not this.

;o)at my age i more roll than rock...

Unless Mike Audet gets chance before me I'll probably be able to test it end of this week or beginning of next week.

I'm currently testing a 2 EDS card setup with a 442 and a c16. I will be adding a RME Digiface/pCI-e combo to the setup too.

Probably gonna test it running Cubase and Paris at once.

Won't be able to do the time code sync part because of not having a MEC and ADAT card.

But should be able to test running Paris thru Cubase as hardware effects inserts and using Cubase as a external effect processor for Paris.

Throwing in a UAD or 2 will certainly push the system. :)

Chris Ludwig

ADK Pro Audio

(859) 635-5762

www.adkproaudio.com

chrisl@adkproaudio.com It's been a while since I checked, but doesn't the Paris MIDI driver

show up in Cubase as an available MIDI input? I seem to remember it doing that at one point.

Could this be used for MTC sync running both on the same computer?

David.

the key* from inside the slot, which would make it *physically* universal.

But whether or not they did, the PCI 2.3 statement gives me pause - that definitely seems to be the one where the PCI spec discontinued its support for cards like the EDS.
