eed to poke around in my bios some more but my AMD 64
4200 dual core CPU is operating at 2200MHz? Is this normal? Does this mean
each core is operating at this speed, or both?

It's a bit faster than the XP 3000 that I was using on my old mobo, but
nothing tht would call for a tickertape parade.

Perhaps the juju is in the ability of these to handle heavier processing
loads?

Right now, I'm underwhelmed, but I haven't had a chance to really use this
for anything other than booting Windows and loading drivers.

;oPHmmmm.....just checked my system info and now it shows two CPU's each
running at 2202MHz. This wasn't the situation last night. Also, the system
is running faster this morning than it was last night when I was having
problems with the drivers.....much faster. I'll post more about this as I
get into it.

Now that I've Ghosted the system drive, I'm getting ready to do the OS
tweaking., load drivers, etc.

I'll be coming up for air in a couple of hours.

Maybe it's time to move the '450 to another box and get a '750??

David.

nothing else is sharing with them.. I'm getting ready to install my UAD-1 cards.

Now the question.....I wondering if ACPI is intelligent enough so that even if I come up with the UAD-1 cards sharing IRQ's with the RME cards or other devices, they will still work. I seem to recall Brian T saying he had lots of stuff sharing and was having no problems.

If I start having problems, I'm going to need to revert to standard PC mode. I have forgotten how to do this, short of reinstalling Windows. I wrote it down somewhere but I can't find it.

If someone would be so knnd, it would be appreciated.

Thanks,

DeeJl don't think you will have an issue with ACPI... but here it is:

Device manager, Expand Computer Icon, Right click on ACPI PC and "update driver"

- No, not this time - Next
- Install from a list - Next
- Don't search, I will choose - Next
- Scoll down to Standard PC... you can figure it out from here (I hope).

;-)

David.

including the VIA 4in1 driver install, with the exception of the VIA AGP
driver. There was an option to untick this so I did. Worked perfectly.
Everything is coming along nicely now.

I'm loading my RME Drivers and then I'm going to load the UAD-1 drivers and
then install the cards. Hopefully the ACPI will work OK. If not, I'll try
Standard PC.....if I can figure it out ;o)

The real trouble started right after my driver load for the Houston controller hung when installing off the factory CD. I had to shut down Windows in mid stride and that's when everything went to hell in a handbasket. I had some other Houston drivers that I had downloaded and though these didn't hang the system, they didn't work either.

I finally had so much weirdness happening that it ended up with having BSOD's. I removed it from device manager, unplugged the controller, went into safe mode and hunted down the driver and killed it by renaming it. Then I was still getting BSOD's so I uninstalled my UAD-1 software and they stopped. Reinstalled and they started again....the IRQ less than equal thing.....so I went back into saf

of time and disk space, you have unlimited plugins.

Example. You have a track on track 10 and you want to render this to
track 11. In the Patchbay:

Mixer-A channel 11 connects to MEC-Master-A Digital In Left
MEC-Master-A Digital In Left connects to Mixer-A-Insert Return10
MEC-Master-A Digital Out Left connects to Mixer-A-Insert Send10
Select "External" on the EDS insert on the source channel.

bus as a mixdown muting all other tracks through the submix group or as
individual channels. Take the resultant L/R files and place them in a track.

OR

There is an easier way. Use the Paris VST plugin on a native insert. They
did a fantastic job of emulating the EQ on the port.
